

5 extending therein, said aperture being generally centrally located in said
 front wall;
a plug being removably extendable into opening;
an injector for selectively injecting fluid into said housing including a nozzle
 fluidly coupled to a container, said nozzle being removably extendable
10 into said aperture for delivering fluid from said container into said
 housing, a one way valve being fluidly coupled to said aperture and being
 positioned within said inner space for preventing fluid within said housing
 from exiting said housing through said aperture;
a covering for selective positioning over and closing said aperture, a nub being
15 attached to said covering and generally being centered thereon such that
 said nub extends away from said housing when said covering is positioned
 over said aperture; and
wherein a fluid may be selectively added into or removed from said housing until
 said housing has a desired size.

20 2. (currently amended) The ~~prosthetic breast device of~~ kit according to claim
1, wherein said opening is positioned in said back wall.

 3. (currently amended) The ~~prosthetic breast device of~~ kit according to claim
25 1, wherein said latex has an ultimate elongation capability greater than 400% and a
tensile strength greater than 12 MPa.

 4. (currently amended) The ~~prosthetic breast device of~~ kit according to claim
30 3, wherein said latex comprising a nitrile polymer.

 5. (currently amended) The ~~prosthetic breast device of~~ kit according to claim
1, wherein said back wall has perimeter length generally between 25 cm and 50 cm and a
maximum distance between inner surfaces of said front and back walls is generally
between 6 cm and 12 cm when said front and back walls are in a relaxed state.

5 Claim 6 (cancelled)

7. (currently amended) ~~The prosthetic breast device of~~ kit according to claim 6, wherein said aperture is positioned within a generally circular depression in an outer surface of said front wall, ~~a covering for selective positioning over and closing said aperture~~ said covering includes a disc member having a shape adapted for positioning within said depression, said disc member having a greater thickness than a depth of said depression such that said disc extends above said outer surface of said front wall when said disc is positioned within said depression, wherein said nub is attached to said disc and is generally centered thereon.

15 Claims 8 and 9 (cancelled)

10. (currently amended) ~~The prosthetic breast device of~~ kit according to claim 6 1 further including an encasement being positioned over said housing, said encasement comprising an elastic cloth material, said encasement having at least one opening therein.

11. (currently amended) A prosthetic breast ~~device having selective inflation,~~ said device kit comprising:

a housing having a back wall having a peripheral edge, a front wall being attached to and extending along a length of said peripheral edge such that an inner space is defined between said front and back walls, said front wall having a convex shape such that said front wall extends outwardly away from said back wall, said housing having an opening therein, said opening being positioned in said back wall, said back wall and said front wall comprising a latex material having a thickness generally between .08 mm and 2.0 mm, said latex having an ultimate elongation capability greater than 400%, said latex having a tensile strength greater than 12 MPa, said latex comprising a nitrile polymer, said back wall having perimeter length generally between 25 cm and 50 cm, a maximum distance between inner surfaces of said front and back walls being generally between 6 cm and 12 cm when

5 said front and back walls are in a relaxed state, said front wall having an
aperture extending therein, said aperture being generally centrally located
in said front wall, said aperture being positioned within a generally
circular depression in an outer surface of said front wall;
a plug being removably extendable into opening;
10 an injector for selectively injecting fluid into said housing including a nozzle
fluidly coupled to a container, said nozzle being removably extendable
into said aperture for delivering fluid from said container into said
housing;
a covering for selective positioning over and closing said aperture, said covering
15 including a disc member having a shape adapted for positioning within
said depression, said disc member having a greater thickness than a depth
of said depression such that said disc extends above said outer surface of
said front wall when said disc is positioned within said depression, a nub
being attached to said disc and generally centered thereon such that said
20 nub extends away from said housing when said disc is positioned within
said depression;
a one way valve being fluidly coupled to said aperture and being positioned
within said inner space for preventing fluid within said housing from
exiting said housing through said aperture; and
25 wherein a fluid may be selectively added into or removed from said housing until
said housing has a desired size.

12. (new) A prosthetic breast device comprising:

30 a housing having a back wall having a peripheral edge, a front wall being attached
to and extending along a length of said peripheral edge such that an inner
space is defined between said front and back walls, said front wall having
a convex shape such that said front wall extends outwardly away from said
back wall, said housing having an opening therein, said opening being
positioned in said back wall, said back wall and said front wall comprising
35 a latex material having a thickness generally between .08 mm and 2.0 mm,

5 said front wall having an aperture extending therein, said aperture being
generally centrally located in said front wall, said aperture being
positioned within a generally circular depression in an outer surface of
said front wall;
a plug being removably extendable into opening;
10 a covering for selective positioning over and closing said aperture;
a one way valve being fluidly coupled to said aperture and being positioned
within said inner space for preventing fluid within said housing from
exiting said housing through said aperture; and
wherein a fluid may be selectively added into or removed from said housing until
15 said housing has a desired size.

13. (new) The device according to claim 12, wherein said covering includes a
disc member having a shape adapted for positioning within said depression, said disc
member having a greater thickness than a depth of said depression such that said disc
20 extends above said outer surface of said front wall when said disc is positioned within
said depression, a nub being attached to said disc and generally centered thereon such
that said nub extends away from said housing when said disc is positioned within said
depression

25 14. (new) The device according to claim 12, further including an encasement
being positioned over said housing, said encasement comprising an elastic cloth material,
said encasement having at least one opening therein.
